1 Project Overview

What is being built, for whom, and on what stack

This document is the **technical & functional build specification** for the IIBS Global University website, derived from the client's Website Project Kickoff Form. It is written for the development team and covers everything needed to start building — architecture, sitemap, features, CMS, integrations, hosting, and content dependencies — without the commercial or marketing material that isn't relevant to the build itself.

Item	Summary
Client	IIBS Global University, Bengaluru
Industry	Education / EdTech
Website type	Corporate / branding website for an educational institution, 16–30 pages, Mega Menu navigation
Technology	Laravel / PHP Custom (client-selected) — see Section 2
Core business goals driving the build	Generate admission enquiries/leads, build brand credibility, educate visitors about programs and outcomes
Target audience	Students, age 16–30, Pan-India, mobile-first
Domain	iibsglobaluniversity.com (hosting/DNS handled separately with the client)

How to read this document: Several fields on the original kickoff form were left blank (design tone, brand assets, hosting status, specific integrations). Wherever that happened, this document records the field as **Pending Client Input** and proposes a **Recommended Default** so development can proceed without being blocked — confirm or override these with the client before they're locked into the build.

1.1 What's in This Document

1. Technology Stack (Section 2)
2. Information Architecture & Sitemap (Section 3)
3. Functional Requirements (Section 4)
4. Admin Panel / CMS Requirements (Section 5)
5. Design Requirements (Section 6)
6. Non-Functional Requirements (Section 7)
7. Content & Asset Responsibility (Section 8)
8. Development Timeline (Section 9)

Commercial terms, SEO/marketing retainers, and AMC plans are covered in separate client-facing documents and are intentionally excluded here.

2 Proposed Technology Stack

Built on Laravel / PHP, as selected by the client

The kickoff form specifies **"Laravel / PHP Custom"** as the preferred technology platform. The stack below is Matrix Bricks' standard, production-grade Laravel architecture, sized for a 16–30 page institutional website with room to grow into a student portal or LMS integration later without a rebuild.

Backend	Frontend	Content & Media	Infrastructure
• PHP 8.3+ • Laravel 11.x (LTS-track) • MySQL 8 database • Laravel Sanctum (auth, if a student/member login is added) • Laravel Queues + Redis (form emails, notifications)	• Blade templating engine • Tailwind CSS for a bold, modern, high-impact UI • Alpine.js for lightweight interactivity • Laravel Livewire for dynamic components (program filters, multi-step admission form)	• Custom Laravel CMS / admin panel (Section 5) • Spatie Media Library for image & document handling • Spatie Sitemap for auto-generated sitemap.xml • Intervention Image for responsive image optimisation	• Nginx + PHP-FPM on Ubuntu LTS • Git / GitHub for version control • GitHub Actions for CI/CD deployment • Let's Encrypt SSL, Cloudflare CDN (recommended)

2.1 Why This Stack Fits the Brief

Requirement	How the Laravel stack addresses it
Mega Menu navigation with 16–30 pages	Laravel's route/controller structure and a database-driven menu builder in the admin panel make deep navigation trees easy to manage without hardcoding links.
Client wants to edit content post-launch	Custom CMS gives non-technical staff a simple dashboard for pages, programs, blog posts, and enquiry leads (Section 5) — no developer needed for routine updates.
Lead generation as the #1 goal	Server-side validated forms, Google reCAPTCHA v3, queued email notifications, and an optional CRM webhook keep every enquiry captured and delivered reliably.
Future growth (student portal, LMS, ERP)	Laravel's ecosystem (Sanctum/Breeze for auth, Passport for API, Nova/Filament for admin panels) means the same codebase can extend into a login-gated student area later.
SEO & performance for a first-time website	Server-rendered Blade views (not a heavy SPA) index cleanly with search engines; Laravel's caching layer keeps program/course pages fast even as content grows.

No preference was indicated for hosting environment beyond the framework choice; hosting, domain, and DNS setup will be confirmed with the client separately before deployment.

3 Information Architecture & Sitemap

Proposed 16–30 page structure for a mid-size university website

The kickoff form's "Key Pages Required" checklist was left unmarked, so the sitemap below has been built from standard information architecture for competing/benchmark university websites (LPU, Manipal, SRM, UPenn, Plaksha), scaled to the client's confirmed **16–30 page, mid-size** bracket and **Mega Menu** navigation choice. Items marked **Recommended** can be removed; the structure can also flex upward within the 16–30 page band as program / department counts are confirmed.

1. Home

2. About IIBS Global University

2.1 Our Story / History · 2.2 Vision, Mission & Values · 2.3 Leadership Message · 2.4 Accreditations & Approvals

3. Programs & Courses Dynamic listing + template

3.1 Undergraduate Programs · 3.2 Postgraduate Programs · 3.3 Diploma / Certificate Programs

Each program renders from one reusable Laravel template: overview, eligibility, curriculum, fees, career outcomes, CTA

4. Admissions

4.1 Admission Process · 4.2 Eligibility Criteria · 4.3 Fee Structure · 4.4 Scholarships · 4.5 Online Application / Enquiry Form

5. Campus & Infrastructure

5.1 Facilities & Labs · 5.2 Hostel & Campus Life · 5.3 Library

6. Faculty & Departments

7. Placements & Careers Recommended

7.1 Recruiters & Statistics · 7.2 Student Success Stories

8. Student Life Recommended

8.1 Clubs & Societies · 8.2 Events & Fests

9. International Students Recommended

10. Alumni & Testimonials

11. Gallery (Photos & Videos)

12. Blog / News & Events

13. Downloads (Prospectus / Brochure)

14. Careers at IIBS Recommended – supports "Recruit Talent" goal

15. FAQs

16. Contact Us

Click-to-call, WhatsApp, embedded Google Map, campus address, enquiry form

17. Legal / Policy Pages Standard, non-nav footer pages

Privacy Policy · Terms & Conditions · Refund / Cancellation Policy

18. Utility Pages Standard, non-nav

404 Error Page · Thank-You / Confirmation Page (post-enquiry)

Pages 1–16 above are the primary Mega-Menu-navigable pages (16 top-level entries); each Program page and each Department page is a separate content record using a shared template, so total published page count naturally lands in the client-confirmed 16–30 range as programs/departments are finalised. Sections 17–18 are supporting pages not counted against the navigation but included in the technical build.

3.1 Navigation

Element	Specification
Primary navigation	Mega Menu, as specified by the client — Programs, Admissions, and About will each expand into a multi-column dropdown grouping their sub-pages.
Header elements	Not selected on the kickoff form (Search Bar, Login, Customer Care Number, WhatsApp Button, Language Switcher, Cart were all left unchecked). Recommended: Customer Care Number + WhatsApp Button in the header, given the lead-generation goal, plus a Search Bar once program count grows past ~15 items.
Social icons	Not selected. Recommended: Facebook, Instagram, LinkedIn, YouTube — the four platforms most used by Indian university applicants and their parents.
Language requirements	Not selected (English / Arabic RTL / Other all left blank). Recommended default: English only for Phase 1, given a Pan-India audience; multi-language can be added later using Laravel's built-in localization.

4 Functional Requirements

Module-by-module behaviour of the website

4.1 Homepage

- Hero banner introducing IIBS Global University and its core value proposition
- Highlights strip: accreditations, ranking/recognitions, years of excellence, placement highlights
- Program highlights carousel linking into Section 3 of the sitemap
- Testimonials / student success snapshot
- Primary enquiry form / "Apply Now" call-to-action above the fold and repeated on scroll (sticky CTA bar)
- Latest news / blog teaser strip

Homepage Topics to Highlight and Animation / Carousel Effects were left blank on the kickoff form. Given the confirmed "Bold / High-Impact" design style, the recommended default is a hero banner slider, scroll-triggered section animations, and animated counters for key statistics (years of operation, students, placements) — all performance-budgeted so they don't compromise page speed.

4.2 Program / Course Pages

One reusable Laravel Blade template driven by a programs database table, rendering: program name & overview, duration & eligibility, curriculum / semester structure, fee information, career outcomes, related faculty, and a program-specific enquiry form. New programs can be added by staff through the admin panel without developer involvement.

4.3 Admission Enquiry & Lead Capture

Feature	Detail
Enquiry forms	Present on Homepage, Admissions, and every Program page; fields: Name, Phone, Email, Program of Interest, City — kept short to reduce drop-off for a mobile audience.
Validation & spam protection	Laravel server-side validation + Google reCAPTCHA v3 (invisible, no user friction).
Notification	Instant email to the admissions team via a queued Laravel job; each lead also stored in the admin panel's Leads module (Section 5.2) for follow-up and export.
CRM sync	"Special Technical Requirements" (CRM Integration, Lead Forms + CRM Auto-sync) were left unchecked on the kickoff form. Recommended: build the lead form to POST to a webhook endpoint from day one, so a CRM (e.g. HubSpot, Zoho, or Salesforce, as confirmed by the client) can be plugged in later with no rework.
WhatsApp	WhatsApp click-to-chat button was not selected; recommended given the target audience's channel preference — low development cost, high enquiry-capture value.

4.4 Search & Filtering

Program listing pages will support filter-by-level (UG/PG/Diploma) and keyword search using MySQL full-text search, upgradable to Laravel Scout + a hosted search driver if the program catalogue grows significantly.

4.5 Blog / News & Events

A category-and-tag driven blog module (news, events, announcements) supporting the "Educate / Inform" goal and keeping the site's content fresh and giving the CMS team an easy way to publish updates on an ongoing basis.

4.6 Careers at IIBS

Recommended addition supporting the unselected-but-implied "Recruit Talent" goal: a simple job listing with an apply-with-CV form, using the same Laravel form/notification pipeline as the admission enquiry form.

4.7 Testimonials, Gallery & Social Proof

Managed testimonial and gallery modules (photo/video) in the admin panel, used across the Homepage, About, Placements, and Student Life pages to reinforce brand credibility.

4.8 FAQs

An accordion-style FAQ module, grouped by topic (Admissions, Fees, Campus Life), editable from the admin panel — reduces enquiry-form load by answering common questions directly.

5 Admin Panel / CMS Requirements

What the client's team can manage after launch

Because the kickoff form indicates the client's internal team should be able to maintain the site independently over time, a custom Laravel admin panel is included in scope (built on Laravel Breeze/Filament conventions), providing:

5.1 Content Management

- Create / edit / delete pages, programs, faculty profiles, blog posts, testimonials, gallery items, and FAQs
- Drag-and-drop Mega Menu builder for navigation structure
- Image upload with automatic resizing/optimisation (Spatie Media Library)
- SEO fields (meta title, meta description, OG image) on every content type

5.2 Leads & Enquiries

- Centralised inbox of all admission enquiry / contact / careers submissions
- Status tracking (New, Contacted, Converted, Not Interested) for the admissions team
- CSV export for offline follow-up or manual CRM import

5.3 User & Role Management

- Role-based access (Super Admin, Content Editor, Admissions Staff) so different departments can be given only the access they need
- Activity log of content changes

5.4 Reporting

- Basic on-dashboard stats: enquiries this month, most-viewed programs, latest blog posts
- Deep analytics (traffic, conversion funnels) handled via Google Analytics 4, set up separately and not duplicated inside the CMS

Training: A recorded walkthrough plus a live training session for the client's content team is included at launch, covering all items in Sections 5.1–5.4.

6 Design Requirements

Visual direction, benchmarks, and open decisions

6.1 Confirmed Direction

Attribute	Value
Design style	Bold / High-Impact (only option selected on the kickoff form)

Reference websites	lpu.in · manipal.edu · srmist.edu.in · upenn.edu · plaksha.edu.in
Competitor websites to outperform	paruluniversity.ac.in · christuniversity.in · reva.edu.in
Page volume	16–30 pages (mid-size)

6.2 Open Decisions

Pending Client Input

Field	Status & Recommendation
Preferred colour palette	Left blank.
What client likes about reference sites	Left blank — layout, colour, animation, and typography preferences not yet articulated.

Recommendation: Before UI design starts, Matrix Bricks will run a short design-direction workshop with the client to lock a colour palette and typography system, using the five reference sites as a moodboard starting point. This avoids revision cycles later and is the single most valuable 30-minute conversation to have before design begins.

6.3 Responsive Design

All templates will be designed mobile-first and tested across common breakpoints (mobile, tablet, laptop, large desktop), consistent with a target audience that predominantly browses and applies via smartphone.

7 Non-Functional Requirements

Performance, security, accessibility, and quality bars

Category	Requirement
Performance	Target Google PageSpeed / Core Web Vitals score of 85+ on mobile for content pages; lazy-loaded images and optimised assets throughout.
Security	Laravel's built-in CSRF protection, parameterised queries (no raw SQL), hashed credentials, HTTPS-only cookies, rate-limited forms, and Google reCAPTCHA on all public forms.
Scalability	Stateless application layer + Redis-backed caching/queues so the site can handle enquiry traffic spikes around admission deadlines without a re-architecture.
Browser support	Latest two versions of Chrome, Safari, Edge, and Firefox; graceful degradation on older mobile browsers.
Accessibility	WCAG / Accessibility Compliance was not selected as a special technical requirement. Recommended baseline: WCAG 2.1 AA where feasible (semantic HTML, alt text, colour contrast, keyboard navigation) as good practice for an education audience, at no significant extra cost when built in from the start.
Data protection	Enquiry data handled per India's Digital Personal Data Protection (DPDP) Act expectations — a Privacy Policy page, and admin-only access to submitted personal data.
SEO-readiness	Clean, human-readable URLs, server-rendered HTML (not a client-side-only SPA), structured data via schema.org (EducationalOrganization, Course).

8 Content & Asset Responsibility

Who provides what, before development can finish

The "Brand Kit & Assets" section of the kickoff form was submitted with no boxes checked (Logo, Brand Colours, Typography, Brand Guidelines, Photography, Videos, and Icons were all left blank), and "Content / Copy Status" was similarly left unanswered. The table below is a responsibility matrix (RACI-style) to close that gap before design work can begin, since design and copy are sequential dependencies.

Asset	Status	Owner (Recommended)	Notes
Logo (vector: AI/EPS/SVG)	Not received	Client	Required before final UI design; PNG/JPG-only logos will need to be vectorised by Matrix Bricks if no source file exists.
Brand colours / typography	Not received	Joint	To be finalised in the Section 6.2 design workshop if no existing brand guideline exists.
Brand guidelines document	Not received	Client (if it exists)	If none exists, Matrix Bricks will define a lightweight style guide as part of the UI design phase.
Photography / campus & student images	Not confirmed	Client, with Matrix Bricks sourcing stock as a fallback	Authentic campus photography is strongly recommended over stock imagery for a credibility-focused brief.
Page copy / content	Not confirmed	Client, or Matrix Bricks copywriting as an add-on	Please confirm whether IIBS will supply final copy per page, or wants Matrix Bricks to draft copy for review.
Program / course details	Not received	Client (subject-matter data)	Needed per program: eligibility, curriculum, fees, duration — the single biggest content dependency for a 16–30 page education site.
Faculty details & photos	Not received	Client	—
Testimonials / placement data	Not received	Client	—

Why this matters: In a Laravel build, front-end templates and the CMS's data model are shaped around real content (e.g., how many fields a "Program" needs). Locking these inputs early keeps the timeline in Section 10 realistic; every week of delay in content supply is a week added to the go-live date.

9 Development Timeline

35–40 working days from kickoff to launch-ready build

Development is scoped to run **35–40 working days**, assuming content and brand assets (Section 8) begin arriving within the first 2–3 days. This covers discovery and UI design, backend and CMS development, frontend template development, content integration, a dedicated backend & CMS testing pass (form validation, CMS CRUD operations, role/permission checks, integration testing, and cross-browser/cross-device testing), and final UAT and launch. This is a build timeline for the Laravel application itself — commercial/legal timelines are tracked separately.

Total development timeline: **35–40 working days**, assuming timely content/asset delivery and no major scope changes mid-build. A short post-launch warranty window for defect fixes follows launch, tracked outside this development schedule.
